## **CHANGES REQUIRED BASED ON ISSUES FOUND**

1. Individual voter information access needs to be updated and hardened to reflect modern private sector login requirements, & any changes by the voter should require 2FA authentication.
2. Statutes to prohibit windows-based and end of life software for voting machines, Linux provides a much more secure environment.
3. Statutes to prohibit the ability of, and action of, connecting any machine to the internet.
4. Voter roll purging require a well-funded team with specialist tech skills and AI software to identify and remove dead or moved individuals daily.
5. Every machine vendor/potential vendor needs to pass a suitable character assessment to ascertain fitness for election involvement
6. Every voting machine and new voting machine should require rigorous testing from a certified red hack team created for the purpose.
7. The publication of individuals voter information on the web, sold, or placed on the dark web should be made a serious, enforced felon.
8. Strict voter ID laws need to be implemented nationwide.
9. Federal forced and managed certification of all Machines and their software
10. Mandatory machine replacing every election cycle.
11. Complete transparency and release of all voting software, hardware, and process to enable full accountability.
12. A complete nationwide ban on barcode ballots.
13. A standardized post-election audit of every district, county, state and it's various machines, software and paper ballots.
